

Cart System

Create a .NET Core API Application with a Postgresql Database that allows users of the application to create shop and create orders``

Stack and Technologies :

- .NET 6 or 7 (Your Prefereable Choice)
- Use PostgreSQL as Database
- EntityFramework Core as ORM (Code First Approach)
- JWT Authentication Scheme
- Swagger / OpenAPI

Project Checklist :

- Database Must be Generated using EFCore Migrations System
- Users Can register and login using JWT Authentication
- Registration Process implement this fields : **Name, Email, Phone, Password and Profile Picture
- Users Can Register Only as Regular user not Admin
- Each User can Add Products to Cart with Quantity
- Admins Can Add/Edit/Delete/List/Retrieve Products and Check Orders as well as set order status as : Pending, Delivering, Fullfilled
- Users can see their own Current Cart with Items Details and Total Price but not Product Description
- Create an Admin Account via EFCore Models Builder
- Users can Checkout their Current Cart (No real payment, Just automatically convert it to order and then empty user cart or delete it)
- Users can Empty thier own Carts and view thier past orders with status
- Use Repository Pattern with Dependency Injection
- Separate Domain (Models, DTO) in A Class Library
- Use Service Pattern with Dependency Injection
- Retriving Orders should be ordered by Date (Descending) and filtered by user or status and use Pagination

- If user already has abandoned cart then use it, dont create new one until checked out

Delivery Policy :

1. Keep your code private on your personal computer, we will discuss it within a private meeting, therefore we don't need the source code
2. Deliver this Project within timespan of 3 Days at maximum
